

running state

m, ℓ, o

carry a small summary, one block at a time

block 1

local max m_1

block 2

local max $m_2 > m_1$

block 3

local max m_3

update

$m' = \max(m, m_b)$

rescale by

$e^{m-m'}, e^{m_b-m'}$

never hold the whole $N \times N$ row at once - just m (max), ℓ (sum), o (partial output)
