GPT-2 on "The cat sat on the" - what happens after the last block
last block's output (12th of 12), last token
768 numbers
[-3.56, -0.95, -8.19, ...]
final LayerNorm
768 numbers
[-0.28, -0.03, -0.96, ...]
dot product with each row of the token table
50,257 logits
(one per token)
softmax
50,257 probabilities
summing to 1
the same 50,257 x 768 table that turned IDs into vectors in LLM-2 (tied)
the first entries of the real vectors are shown
